

Smarter Homes with Solar Integration

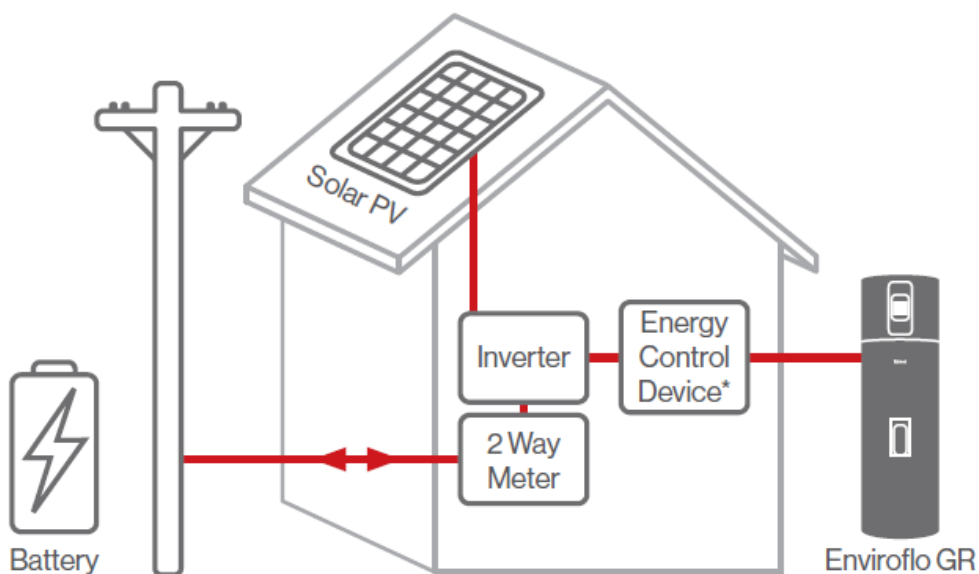

The new Rinnai Enviroflo™ GR Series Hot Water Heat Pump can work in harmony with Solar PV, allowing households to use the electricity they generate on-site to quickly and efficiently heat their water. This smart integration allows homes to maximise their use of self-generated solar energy, optimising energy efficiency and minimising reliance on the grid.

The result is a home that's more efficient, self-reliant, and significantly cheaper to run - the savings on energy bills can be substantial.

Benefits When Paired with Solar PV:

- Enabling renewable-powered hot water
- Increased self-consumption of solar power
- Reduced carbon footprint
- Lower lifetime operating costs
- Improved sustainability and energy independence

How it Works:

*Energy Control Device such as the Catch Control Universal Energy Monitor
